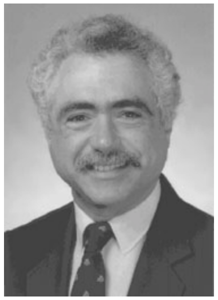
Coreference Resolution

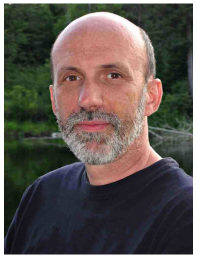
CS224n
Christopher Manning
(borrows slides from Roger Levy, Altaf Rahman, Vincent Ng, Heeyoung Lee)

Knowledge-based Pronominal Coreference

- [The city council] refused [the women] a permit because <u>they</u> feared violence.
- [The city council] refused [the women] a permit because <u>they</u> advocated violence.
  - Winograd (1972)



- See: Hector J. Levesque "On our best behaviour" IJCAI 2013. http://www.cs.toronto.edu/~hector/Papers/ijcai-13-paper.pdf



Hobbs' algorithm: commentary

"… *the naïve approach is quite good. Computationally speaking, it will be a long time before a semantically based algorithm is sophisticated enough to perform as well, and these results set a very high standard for any other approach to aim for.*

"Yet there is every reason to pursue a semantically based approach. The naïve algorithm does not work. Any one can think of examples where it fails. In these cases it not only fails; it gives no indication that it has failed and offers no help in finding the real antecedent." (Hobbs 1978, *Lingua,* p. 345)

Machine learning models of coref

- Start with supervised data
    - positive examples that corefer
    - negative examples that don't corefer
  - Note that it's very skewed
    - The vast majority of mention pairs *don't* corefer
- Usually learn some sort of discriminative model of phrases/ clusters coreferring
  - Predict 1 for coreference, 0 for not coreferent
- But there is also work that builds clusters of coreferring expressions
  - E.g., generative models of clusters in (Haghighi & Klein 2007)

Supervised Machine Learning Pronominal Anaphora Resolution

- Given a pronoun and an entity mentioned earlier, classify whether the pronoun refers to that entity or not given the surrounding context (yes/no)

Mr. Obama visited the city. The president talked about Milwaukee 's economy. He mentioned new jobs.

- Usually first filter out pleonastic pronouns like "It is raining." (perhaps using hand-written rules)
- Use any classifier, obtain positive examples from training data, generate negative examples by pairing each pronoun with other (incorrect) entities
- This is naturally thought of as a binary classification (or ranking) task

Features for Pronominal Anaphora Resolution

- Constraints:
  - Number agreement
    - Singular pronouns (it/he/she/his/her/him) refer to singular entities and plural pronouns (we/they/us/them) refer to plural entities
  - Person agreement
    - He/she/they etc. must refer to a third person entity
  - Gender agreement
    - He → John; she → Mary; it → car
    - Jack gave Mary a gift. She was excited.
  - Certain syntactic constraints
    - John bought himself a new car. [himself → John]
    - John bought him a new car. [him can not be John]

Features for Pronominal Anaphora Resolution

- Preferences:
  - Recency: More recently mentioned entities are more likely to be referred to
    - John went to a movie. Jack went as well. He was not busy.
  - Grammatical Role: Entities in the subject position is more likely to be referred to than entities in the object position
    - John went to a movie with Jack. He was not busy.
  - Parallelism:
    - John went with Jack to a movie. Joe went with him to a bar.

Features for Pronominal Anaphora Resolution

- Preferences:
  - Verb Semantics: Certain verbs seem to bias whether the subsequent pronouns should be referring to their subjects or objects
    - John telephoned Bill. He lost the laptop.
    - John criticized Bill. He lost the laptop.
  - Selectional Restrictions: Restrictions because of semantics
    - John parked his car in the garage after driving it around for hours.
- Encode all these and maybe more as features
  - Learn weights from labeled training data
  - Classify new instances

Evaluation

- B^3 (B-CUBED) algorithm for evaluation
  - Precision & recall for *entities in a reference chain*
  - Precision: % of elements in a hypothesized reference chain that are in the true reference chain
  - Recall: % of elements in a true reference chain that are in the hypothesized reference chain
  - Overall precision & recall are the (weighted) average of per-chain precision & recall
  - Optimizing chain-chain pairings is a hard problem
    - In the computational NP-hard sense
  - Greedy matching is done in practice for evaluation

Evaluation

- B-CUBED algorithm for evaluation

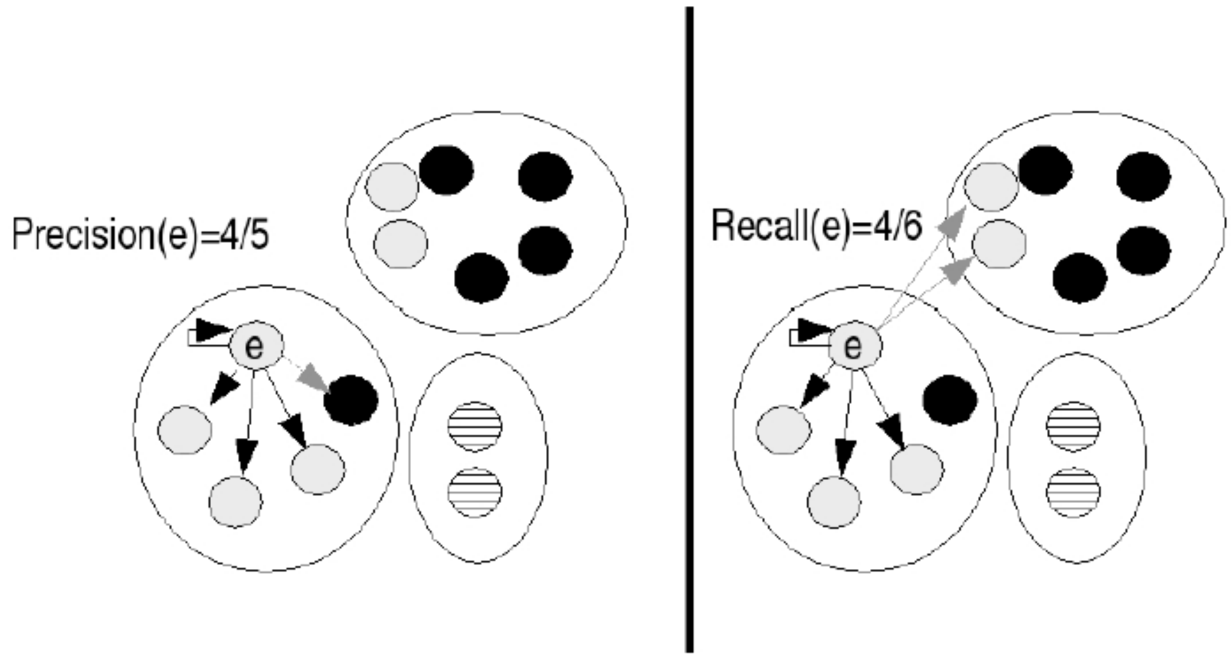


Figure from Amigo et al 2009

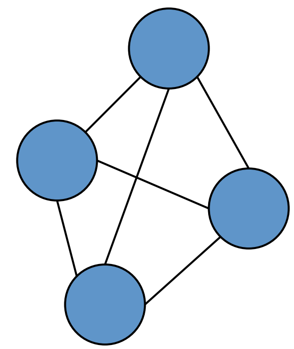
Evaluation metrics

- MUC Score (Vilain et al., 1995)
  - Link based: Counts the number of common links and computes f-measure
- CEAF (Luo 2005); entity based
- BLANC (Recasens and Hovy 2011) Cluster RAND-index
- …

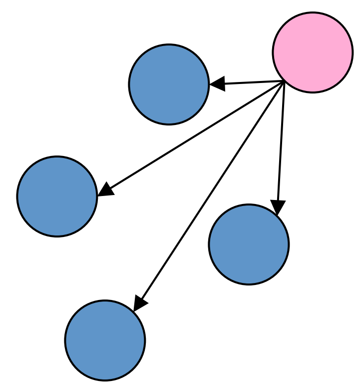
- All of them are sort of evaluating getting coreference links/ clusters right and wrong, but the differences can be important
  - Look at it in PA3

Kinds of Models

- Mention Pair models
  - Treat coreference chains as a collection of pairwise links
  - Make independent pairwise decisions and reconcile them in some way (e.g. clustering or greedy partitioning)



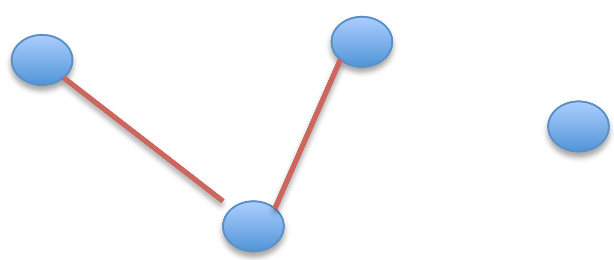
- Mention ranking models
  - Explicitly rank all candidate antecedents for a mention



- Entity-Mention models
  - A cleaner, but less studied, approach
  - Posit single underlying entities
  - Each mention links to a discourse entity [Pasula et al. 03], [Luo et al. 04]

Mention Pair Models

- Most common machine learning approach
- Build a classifier over pairs of NPs
  - For each NP, pick a preceding NP or NEW
  - Or, for each NP, choose link or no-link
- Clean up non-transitivity with clustering or graph partitioning algorithms
  - E.g.: [Soon et al. 01], [Ng and Cardie 02]
  - Some work has done the classification and clustering jointly [McCallum and Wellner 03]
- Failures are mostly because of insufficient knowledge or features for hard common noun cases



Features: Grammatical Constraints

- Apposition
  - Nefertiti, Amenomfis the IVth's wife, was born in …
- Predicatives/equatives
  - Sue is the best student in the class
  - It's questionable whether predicative cases should be counted, but they generally are.

Features: Soft Discourse Constraints

- Recency
- Salience
- Focus
- Centering Theory [Grosz et al. 86]
- Coherence Relations

Other coreference features

- Additional features to incorporate aliases, variations in names etc., e.g. Mr. Obama, Barack Obama; Megabucks, Megabucks Inc.

- Semantic Compatibility
  - Smith had bought *a used car* that morning.
    - *The dealership* assured him it was in good condition.
    - *The machine* needed a little love, but the engine was in good condition.

But it's complicated … so weight features

- Common nouns can differ in number but be coreferent:
  - a patrol … the soldiers
- Common nouns can refer to proper nouns
  - George Bush … the leader of the free world
- Gendered pronouns can refer to inanimate things
  - [India] withdrew her ambassador from the Commonwealth
- Split antecedence
  - John waited for Sasha. And then they went out.

Pairwise Features

1. **strict gender [true or false]**. True if there is a strict match in gender (e.g. male pronoun Pro_i with male antecedent NP_j).
2. **compatible gender [true or false]**. True if Pro_i and NP_j are merely compatible (e.g. male pronoun Pro_i with antecedent NP_j of unknown gender).
3. **strict number [true or false]** True if there is a strict match in number (e.g. singular pronoun with singular antecedent)
4. **compatible number [true or false]**. True if Pro_i and NP_j are merely compatible (e.g. singular pronoun Pro_i with antecedent NP_j of unknown number).
5. **sentence distance [0, 1, 2, 3,...]**. The number of sentences between pronoun and potential antecedent.
6. **Hobbs distance [0, 1, 2, 3,...]**. The number of noun groups that the Hobbs algorithm has to skip, starting backwards from the pronoun Pro_i, before the potential antecedent NP_j is found.
7. **grammatical role [subject, object, PP]**. Whether the potential antecedent is a syntactic subject, direct object, or is embedded in a PP.
8. **linguistic form [proper, definite, indefinite, pronoun]**. Whether the potential antecedent NP_j is a proper name, definite description, indefinite NP, or a pronoun.

Pairwise Features

Category	Features	Remark
Lexical	exact_strm	1 if two mentions have the same spelling; 0 otherwise
	left_subsm	1 if one mention is a left substring of the other; 0 otherwise
	right_subsm	1 if one mention is a right substring of the other; 0 otherwise
	acronym	1 if one mention is an acronym of the other; 0 otherwise
	edit_dist	quantized editing distance between two mention strings
	spell	pair of actual mention strings
	ncd	number of different capitalized words in two mentions
Distance	token_dist	how many tokens two mentions are apart (quantized)
	sent_dist	how many sentences two mentions are apart (quantized)
	gap_dist	how many mentions in between the two mentions in question (quantized)
Syntax	POS_pair	POS-pair of two mention heads
	apposition	1 if two mentions are appositive; 0 otherwise
Count	count	pair of (quantized) numbers, each counting how many times a mention string is seen
Pronoun	gender	pair of attributes of {female, male, neutral, unknown }
	number	pair of attributes of {singular, plural, unknown}
	possessive	1 if a pronoun is possessive; 0 otherwise
	reflexive	1 if a pronoun is reflexive; 0 otherwise

[Luo et al. 04]

Mention-Pair (MP) Model

- Soon et al. 2001 ; Ng and Cardie 2002
- Classifies whether **two mentions** are coreferent or not.
- Weaknesses
  - Insufficient information to make an informed coreference decision.

Mention-Pair (MP) Model

- Soon et al. 2001 ; Ng and Cardie 2002
- Classifies whether **two mentions** are coreferent or not.
- Weaknesses
  - Insufficient information to make an informed coreferenced decision.

Barack Obama ………………Hillary Rodham Clinton …….his

……….. **secretary of state** ……………………..He ….……..her

Mention-Pair (MP) Model

- Soon et al. 2001 ; Ng and Cardie 2002
- Classifies whether **two mentions** are coreferent or not.
- Weaknesses
  - Insufficient information to make an informed coreference decision.
  - Each candidate antecedent is considered independently of the others.

Mention-Pair (MP) Model

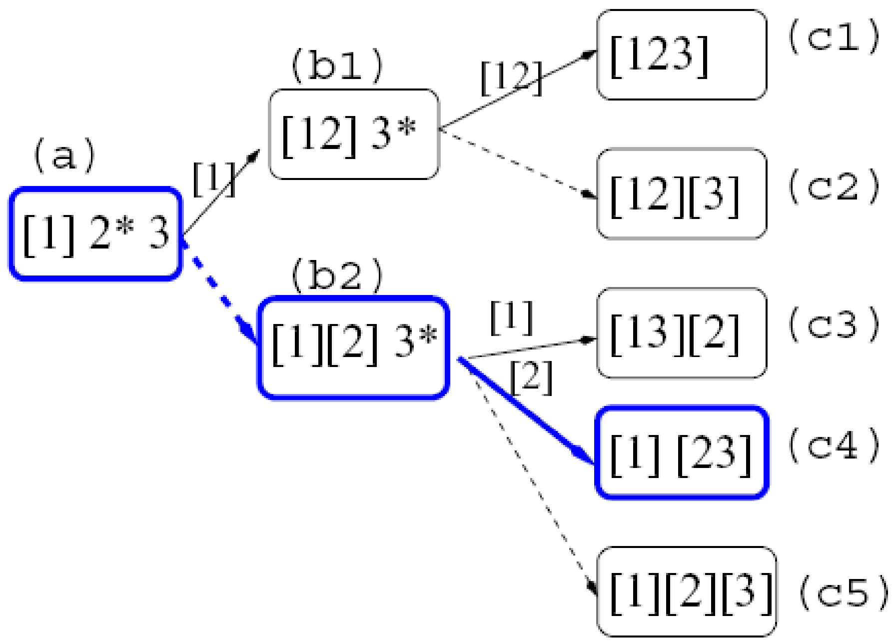
- Soon et al. 2001 ; Ng and Cardie 2002
- Classifies whether **two mentions** are coreferent or not.
- Weaknesses
  - Insufficient information to make an informed coreferenced decision.
  - Each candidate antecedent is considered independently of the others.

Barack Obama ....Hillary Rodham Clinton ....his ....

secretary of state ....the President........He ....**her**

An Entity Mention Model

- Example: [Luo et al. 04]
- Bell Tree (link vs. start decision list)
- Entity centroids, or not?
  - Not for [Luo et al. 04], see [Pasula et al. 03]
  - Some features work on nearest mention (e.g. recency and distance)
  - Others work on “canonical” mention (e.g. spelling match)
  - Lots of pruning, model highly approximate
  - (Actually ends up being like a greedy-link system in the end)



Entity-Mention (EM) Model

- Pasula et al. 2003 ; Luo et al. 2004 ; Yang et al. 2004
- Classifies whether **a mention** and **a preceding, possibly partially formed cluster** are coreferent or not.
- Strength
  - Improved expressiveness.
    - Allows the computation of cluster level features
- Weakness
  - Each candidate cluster is considered independently of the others.

Barack Obama ………………Hillary Rodham Clinton …….his

……….. secretary of state ……………………..He ………….her

Mention-Ranking (MR) Model

- Denis & Baldridge 2007, 2008
- Imposes a **ranking** on a set of candidate antecedents

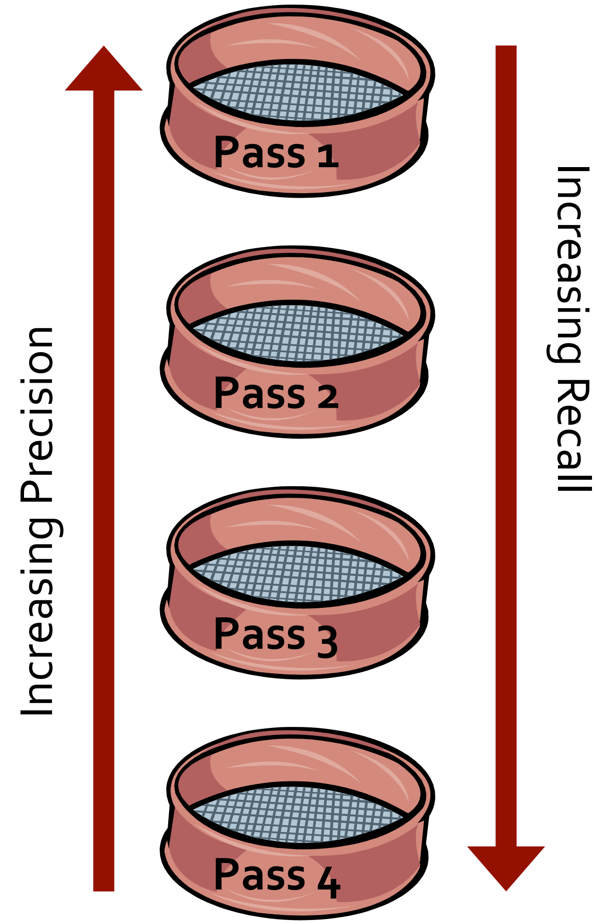
- Strength
  - Considers all the candidate antecedents simultaneously
- Weakness
  - Insufficient information to make an informed coreference decision.

Barack Obama ………………Hillary Rodham Clinton …….his

……….. secretary of state ……………………..He ………….her

Lee et al. (2010): Stanford deterministic coreference

- Cautious and incremental approach
- Multiple passes over text
- Precision of each pass is lesser than preceding ones
- Recall keeps increasing with each pass
- Decisions once made cannot be modified by later passes
- Rule-based ("unsupervised")



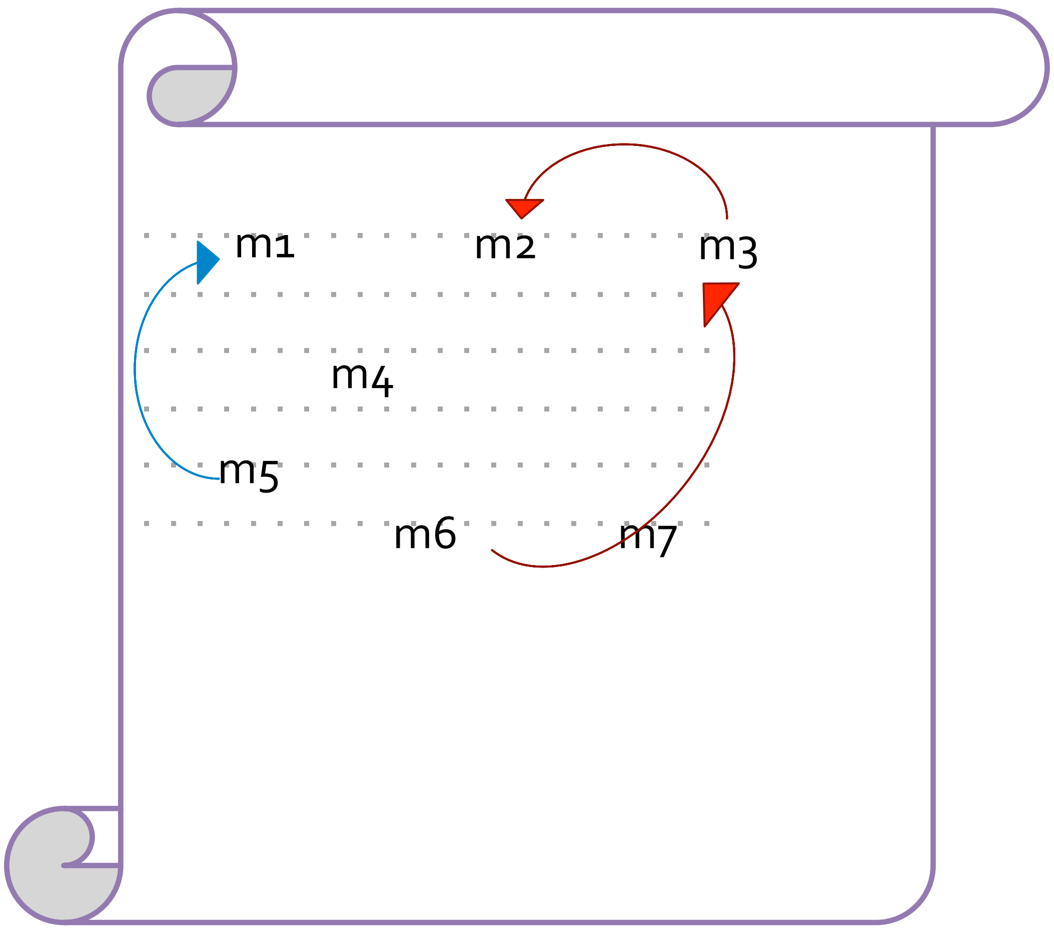
Approach: start with high precision clumpings

E.g.

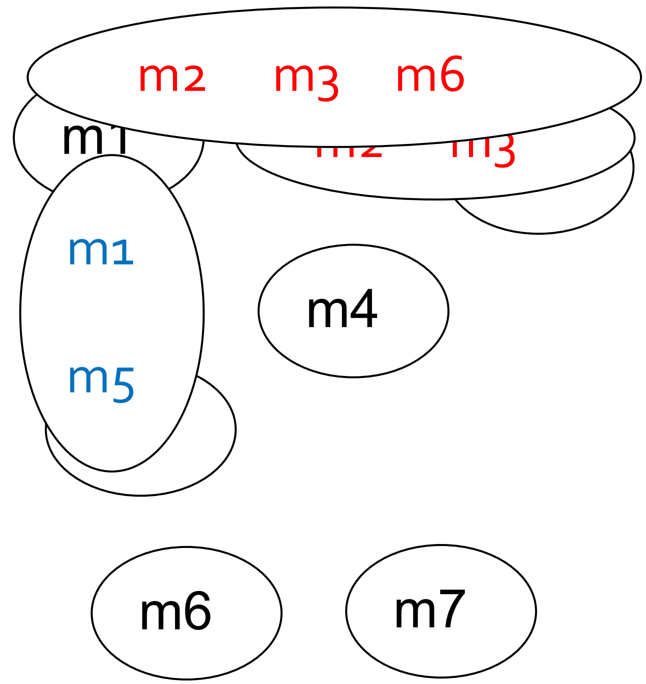
*Pepsi hopes to take **Quaker oats** to a whole new level. ... Pepsi says it expects to double Quaker's snack food growth rate. ... the deal gives Pepsi access to **Quaker oats**' Gatorade sport drink as well as ....*

Exact String Match: A high precision feature

Entity-mention model: Clusters instead of mentions



Clusters:



Detailed Architecture

The system consists of seven passes (or sieves):

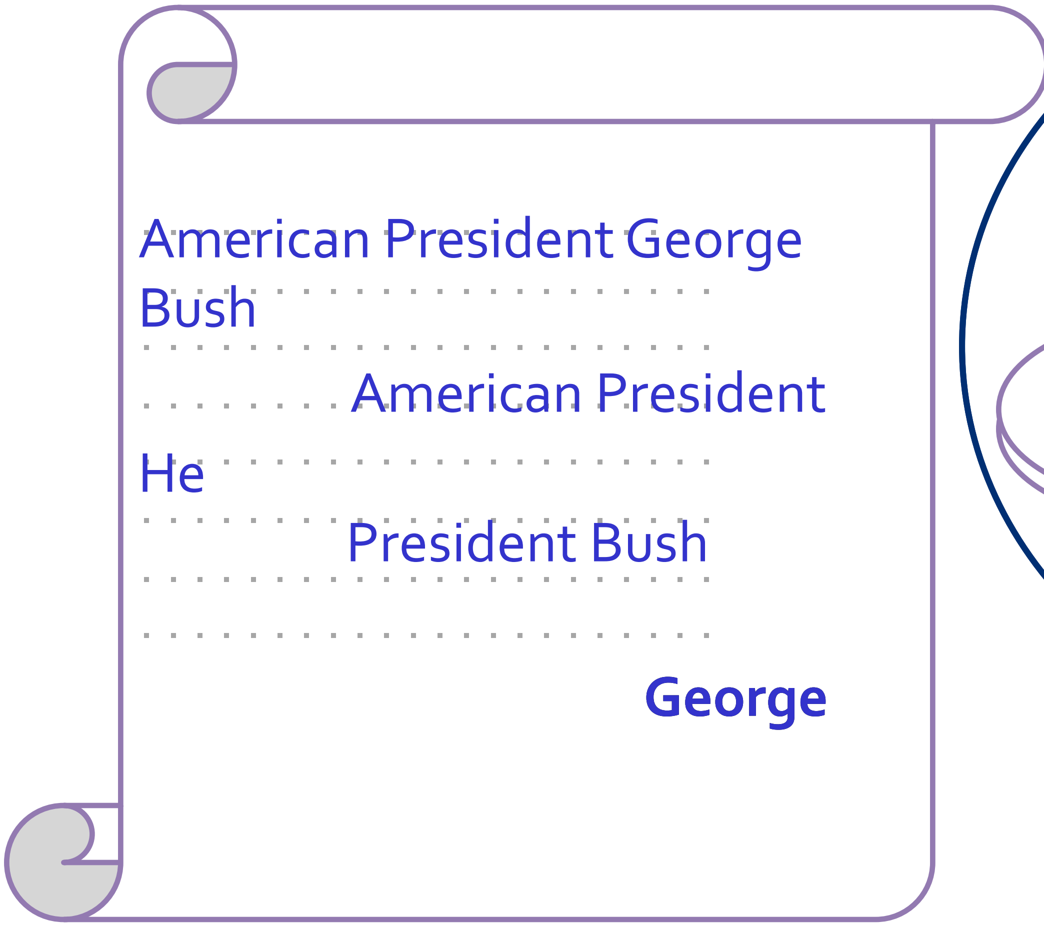
- Exact Match
- Precise Constructs (appositives, predicate nominatives, …)
- Strict Head Matching
- Strict Head Matching – Variant 1
- Strict Head Matching – Variant 2
- Relaxed Head Matching
- Pronouns

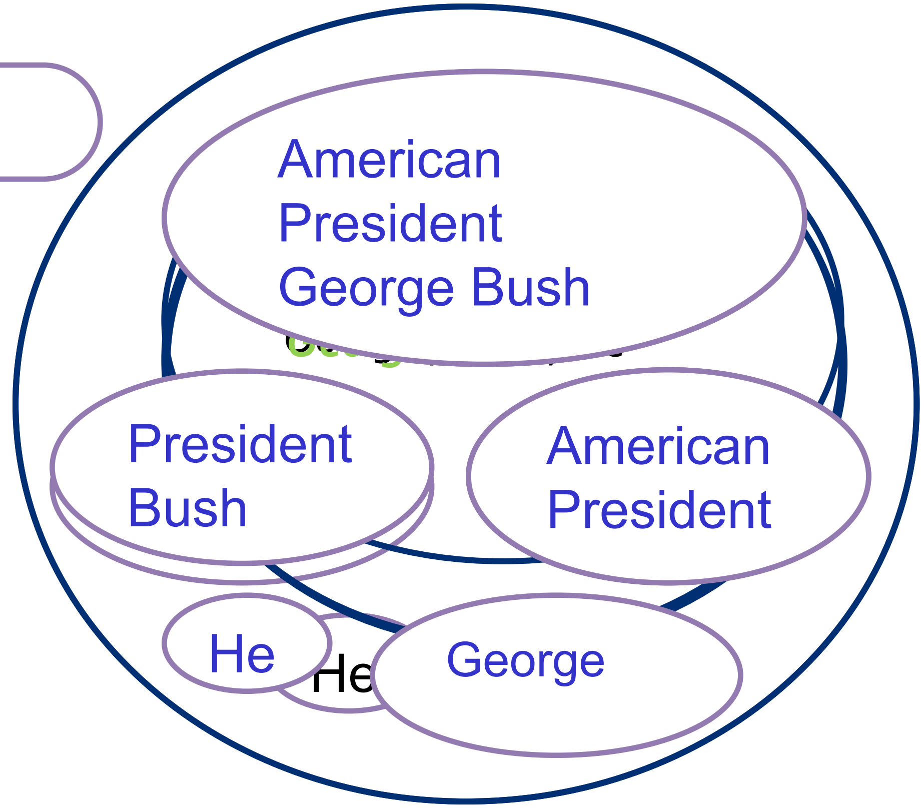
Passes 3 – 5: Examples

- **Pass 3**
  - Yes: "*the Florida Supreme Court*", "*the Florida court*"
  - No: "*researchers*", "*two Chinese researchers*"
- **Pass 4** `(-Compatible Modifiers)`
  - Yes: "*President Clinton*", *{American President, American President Bill Clinton, Clinton}*
- **Pass 5** `(-Word Inclusion)`
  - **Yes**: "*The Gridiron Club at the Greenbrier Hotel*", *{an organization of 60 Washington journalists, The Gridiron Club}*

Pass 6: Relaxed Head Matching

Relaxed Cluster Match



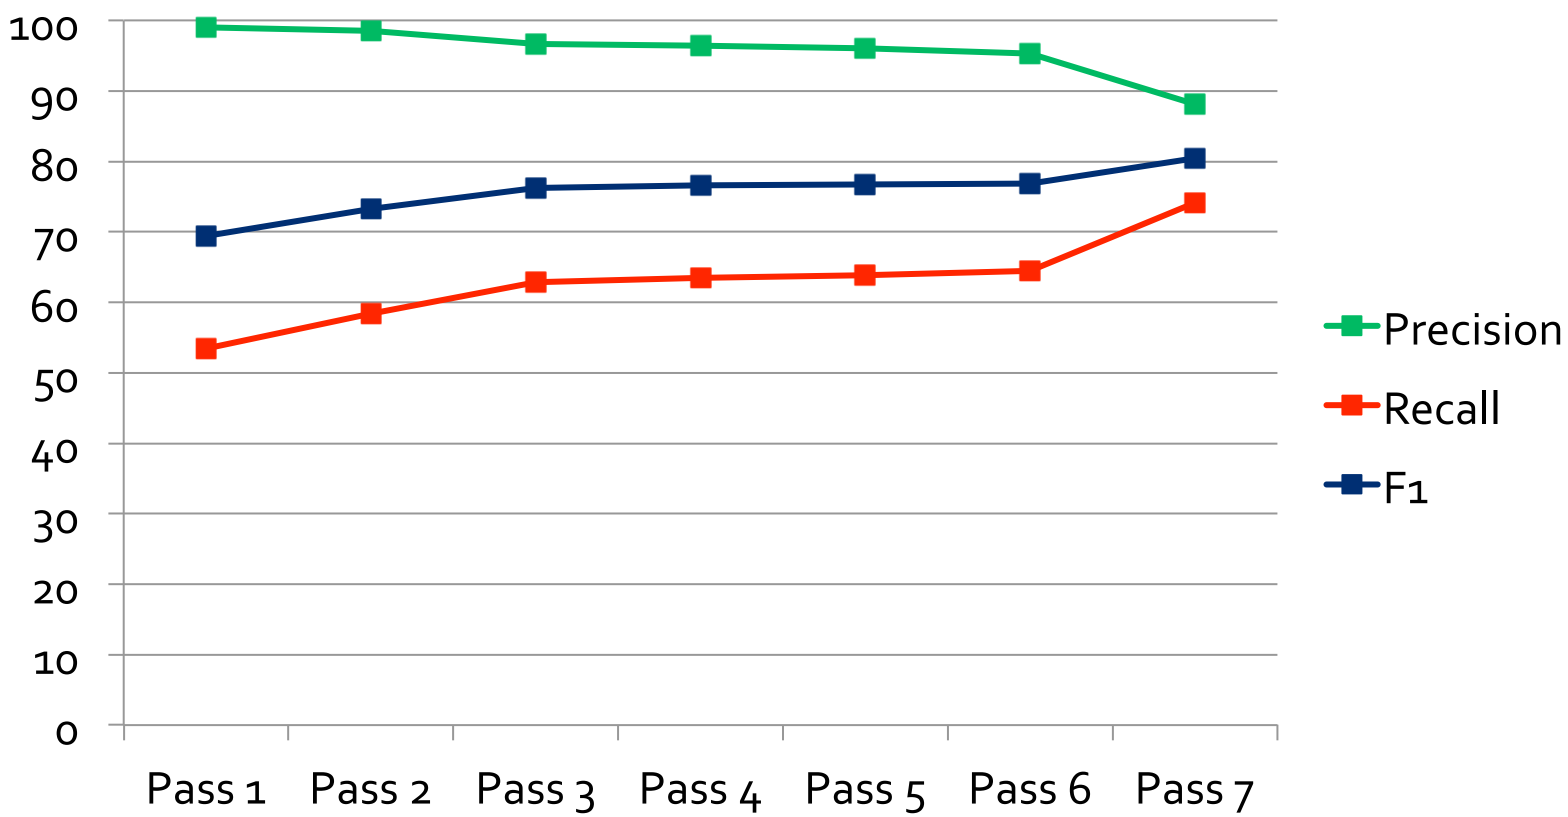


Both mentions have to be named entities of the same type

Pass 7 – Pronoun Resolution

- Attributes agree
  - Number
  - Gender
  - Person
  - Animacy
- Assigned using POS tags, NER labels, static list of assignments for pronouns
- Improved further using Gender and Animacy dictionaries of Bergsma and Lin (2006), and Ji and Lin (2009)

Cumulative performance of passes♪



Graph showing the system's B^3 Precision, Recall and F1 on ACE2004-DEV after each additional pass

CoNLL 2011 Shared task on coref

Official; Closed track; Predicted mentions

System	MD	MUC	B-CUBED	CEAF$_m$	CEAF$_e$	BLANC	Official
	F	F^1	F^2	F	F^3	F	$\frac{F^1+F^2+F^3}{3}$

zhekova	48.29	24.08	61.46	40.43	35.75	53.77	40.43
irwin	26.67	19.98	50.46	31.68	25.21	51.12	31.28

Remarks

- This simple deterministic approach gives state of the art performance!
- Easy insertion of new features or models
  - Done subsequently: Recasens et al. 2013
- The idea of “easy first” model has also had some popularity in other (ML-based) NLP systems
  - Easy first POS tagging and parsing

- It’s a flexible architecture, not an argument that ML is wrong
  - Pronoun resolution pass would be easiest place to reinsert an ML model??
